

Table of contents

- **0 Preface** (p. 016)
- **Chapter A General Premises and Strategies** (p. 020)
- **A1 What is ecodesign?: Designing the biointegration of artificial-systems-to-natural-systems** (p. 022)
- **A2 The objective of ecodesign: Design for benign and seamless environmental integration** (p. 025)
- **A3 The basis for ecodesign: The ecosystem concept** (p. 030)
- **A4 Ecomimicry: Designing based on the ecosystem analogy** (p. 045)
- **A5 The general law and theoretical basis for ecodesign: The system-to-environment Interactions Matrix** (p. 059)
- **Chapter B Design Instructions** (p. 074)
- **B1 Interrogate the premises for the design: Deciding to build, to manufacture or not** (p. 076)
- **B2 Differentiate whether the design is for a product (with no fixed abode or with a temporary abode) or for a structure or an infrastructure (both abode or site specific): Determining the strategy towards the useful lifespan and the site specificity and fixation of the designed system** (p. 088)
- **B3 Determine the level of environmental integration that can be achieved in the design: Establishing specific practical limitations** (p. 093)
- **B4 Evaluate the ecological history of the site (for the designed system): Site selection and establishing the overall site strategy** (p. 098)
- **B5 Inventory the designed system's ecosystem (site-specific design): Establishing the ecological baseline and context for planning and design to protect the ecosystems and to restore disturbed or degraded ecosystems** (p. 107)
- **B6 Delineate the designed system's boundary as a human-made or composite ecosystem in relation to the site's ecosystem: Establishing the general extent for ecosystem and biodiversity enhancement** (p. 130)
- **B7 Design to balance the biotic and abiotic components of the designed system: Integrating the designed system's inorganic mass vertically and horizontally with biomass and designing for the rehabilitation of degraded ecosystems** (p. 133)
- **B8 Design to improve existing, and to create new ecological linkages: Enhancing the biodiversity of the designed system, conserving existent continuities of ecosystems and creating new ecological corridors and links (eg using ecological land-bridges, hedgerows and enhancing horizontal integration)** (p. 150)
- **B9 Design to reduce the heat-island effect of the built environment on the ecology of the locality: Reducing and improving urban micro-climate impacts** (p. 161)
- **B10 Design to reduce the consequences of the various modes of transportation and of the provision of access and vehicular parking for the designed system** (p. 167)
- **B11 Design to integrate with the wider planning context and urban infrastructure of the design system** (p. 178)
- **B12 Design for improved internal comfort conditions (of the designed system as an enclosure): Designing the built system based on the progressive optimisation of modes (B13 to B17)** (p. 184)

- **B13 Design to optimise all passive-mode (or bioclimatic design) options in the designed system: Configuring the built form, its layout and plan, and designing for improved internal comfort conditions without the use of renewable sources of energy and as low-energy design in relation to the climate of the locality (p. 191)**
- **B14 Design to optimise all mixed-mode options in the design system: Designing for improved internal comfort conditions with partial use of renewable sources of energy and as low-energy design in relation to the climate of the locality (p. 229)**
- **B15 Design to optimise all full-mode options in the designed system: Designing for improved internal comfort conditions with minimal full use of renewable sources of energy and as low-energy design in relation to the climate of the locality (p. 238)**
- **B16 Design to optimise productive-mode options in the designed system: Designing for improved comfort conditions by the independent production of energy and as low-energy design in relation to the climate of the locality (p. 244)**
- **B17 Design to optimise composite-mode options in the designed system: Designing for improved internal comfort conditions by composite means with low use of renewable sources of energy and as low-energy design in relation to the climate of the locality (p. 251)**
- **B18 Design to internally integrate biomass with the designed system's inorganic mass (eg by means of internal landscaping, improved indoor air quality (IAQ) considerations, etc) (p. 254)**
- **B19 Design for water conservation, recycling, harvesting, etc: Conserving water resources (p. 262)**
- **B20 Design for wastewater and sewage treatment and recycling systems: Controlling and integrating human waste and other emissions (p. 272)**
- **B21 Design for food production and independence: Designing to promote urban agriculture and permaculture (p. 280)**
- **B22 Design the built system's use of materials to minimise waste based on the analogy with the recycling properties of the ecosystem: Designing for continuous reuse, recycling and eventual biointegration (p. 288)**
- **B23 Design for vertical integration: Designing for multilateral integration of the designed system with the ecosystems (p. 294)**
- **B24 Design to reduce light and noise pollution of the ecosystems (p. 298)**
- **B25 Designing the built environment as the transient management of materials and energy input flows: Assessing inputs and outputs through the designed system and their consequences (p. 307)**
- **B26 Designing to conserve the use of non-renewable energy and material resources (p. 317)**
- **B27 Design for the management of outputs from the built environment and their integration with the natural environment: Designing to eliminate pollution and for benign biointegration (p. 333)**
- **B28 Design the built system over its life cycle from source to reintegration: Designing to enable and facilitate disassembly for continuous reuse, recycling and reintegration (p. 351)**
- **B29 Design using environmentally benign materials, furniture, fittings, equipment (FF&E) and products that can be continuously reused, recycled and reintegrated:**

Assessing the environmental consequences of materials, etc, used in the designed system (p. 376)

- **B30 Design to reduce the use of ecosystem and biospheric services and impacts on the shared global environment (systemic integration) (p. 407)**
- **B31 Reassess the overall design (ie product, structure or infrastructure) in its totality for the level of environmental integration over its life cycle (p. 411)**
- **Chapter C Other Considerations (p. 412)**
- **C1 What is the green aesthetic? (p. 414)**
- **C2 Issues of practice (p. 417)**
- **C3 The future of ecodesign: Prosthetics design as the parallel basis for designing biointegration of artificial-to-natural systems (p. 427)**
- **C4 Appendix 1: Timeline of key international developments relating to the global environment (p. 435)**
- **C5 Appendix 2: Sustainable development (p. 438)**
- **C6 Appendix 3: The Rio Principles (p. 439)**
- **Glossary (p. 441)**
- **Bibliography (p. 463)**
- **Index (p. 477)**
