Table of Contents

- 1 History, Structural Formulation of the Field Through Elementary Steps, and Future Perspectives
- 1.1 Historical Notes
- 1.2 Current Polymer Processing Practice
- 1.3 Analysis of Polymer Processing in Terms of Elementary Steps and Shaping Methods
- 1.4 Future Perspectives: From Polymer Processing to Macromolecular Engineering
- 2.3 Reynolds Transport Theorem
- 2 The Balance Equations and Newtonian Fluid Dynamics
- 2.1 Introduction
- 2.2 The Balance Equations
- 2.4 The Macroscopic Mass Balance and the Equation of Continuity
- 2.5 The Macroscopic Linear Momentum Balance and the Equation of Motion
- 2.6 The Stress Tensor
- 2.7 The Rate of Strain Tensor
- 2.8 Newtonian Fluids
- 2.9 The Macroscopic Energy Balance and the Bernoulli and Thermal Energy Equations
- 2.10 Mass Transport in Binary Mixtures and the Diffusion Equation
- 2.11 Mathematical Modeling, Common Boundary Conditions, Common Simplifying Assumptions, and the Lubrication Approximation
- 3 Polymer Rheology and Non-Newtonian Fluid Mechanics
- 3.1 Rheological Behavior, Rheometry, and Rheological Material Functions of Polymer Melts
- 3.2 Experimental Determination of the Viscosity and Normal Stress Difference Coefficients
- 3.3 Polymer Melt Constitutive Equations Based on Continuum Mechanics
- 3.4 Polymer Melt Constitutive Equations Based on Molecular Theories
- 4 The Handling and Transporting of Polymer Particulate Solids
- 4.1 Some Unique Properties of Particulate Solids
- 4.2 Agglomeration
- 4.3 Pressure Distribution in Bins and Hoppers
- 4.4 Flow and Flow Instabilities in Hoppers
- 4.5 Compaction
- 4.6 Flow in Closed Conduits
- 4.7 Mechanical Displacement Flow
- 4.8 Steady Mechanical Displacement Flow Aided by Drag
- 4.9 Steady Drag-induced Flow in Straight Channels
- 4.10 The Discrete Element Method
- 5 Melting
- 5.1 Classification and Discussion of Melting Mechanisms
- 5.2 Geometry, Boundary Conditions, and Physical Properties in Melting
- 5.3 Conduction Melting without Melt Removal
- 5.4 Moving Heat Sources
- 5.5 Sintering

- 5.6 Conduction Melting with Forced Melt Removal
- 5.7 Drag-induced Melt Removal
- 5.8 Pressure-induced Melt Removal
- 5.9 Deformation Melting
- 6 Pressurization and Pumping
- 6.1 Classification of Pressurization Methods
- 6.2 Synthesis of Pumping Machines from Basic Principles
- 6.3 The Single Screw Extruder Pump
- 6.4 Knife and Roll Coating, Calenders, and Roll Mills
- 7.1 Basic Concepts and Mixing Mechanisms
- 6.5 The Normal Stress Pump
- 6.7 Positive Displacement Pumps
- 6.8 Twin Screw Extruder Pumps
- 7 Mixing
- 6.6 The Co-rotating Disk Pump
- 7.2 Mixing Equipment and Operations of Multicomponent and Multiphase Systems
- 7.3 Distribution Functions
- 7.4 Characterization of Mixtures
- 7.5 Computational Analysis
- 8 Devolatilization
- 8.1 Introduction
- 8.2 Devolatilization Equipment
- 8.3 Devolatilization Mechanisms
- 8.4 Thermodynamic Considerations of Devolatilization
- 8.5 Diffusivity of Low Molecular Weight Components in Molten Polymers
- 8.6 Boiling Phenomena: Nucleation
- 8.7 Boiling-Foaming Mechanisms of Polymeric Melts
- 8.8 Ultrasound-enhanced Devolatilization
- 8.9 Bubble Growth
- 8.10 Bubble Dynamics and Mass Transfer in Shear Flow
- 8.11 Scanning Electron Microscopy Studies of Polymer Melt Devolatilization
- 9 Single Rotor Machines
- 9.1 Modeling of Processing Machines Using Elementary Steps
- 9.2 The Single Screw Melt Extrusion Process
- 9.3 The Single Screw Plasticating Extrusion Process
- 9.4 The Co-rotating Disk Plasticating Processor
- 10 Twin Screw and Twin Rotor Processing Equipment
- 10.1 Types of Twin Screw and Twin Rotor-based Machines
- 10.2 C
