

- Preface
- 1 Introduction and preliminaries
 - Finite elements in fluid dynamics
 - Subjects covered
 - Kinematical descriptions of the flow field
 - The basic conservation equations
 - Basic ingredients of the finite element method
- 2 Steady transport problems
 - Problem statement
 - Galerkin approximation
 - Early Petrov-Galerkin methods
 - Stabilization techniques
 - Other stabilization techniques and new trends
 - Applications and solved exercises
- 3 Unsteady convective transport
 - Introduction
 - Problem statement
 - The methods of characteristics
 - Classical time and space discretization techniques
 - Stability and accuracy analysis
 - Taylor-Galerkin Methods
 - An introduction to monotonicity-preserving schemes
 - Least-squares-based spatial discretization
 - The discontinuous Galerkin method
 - Space-time formulations
 - Applications and solved exercises
- 4 Compressible Flow Problems
 - Introduction
 - Nonlinear hyperbolic equations
 - The Euler equations
 - Spatial discretization techniques
 - Numerical treatment of shocks
- 5 Unsteady convection-diffusion problems
 - Nearly incompressible flows
 - Fluid-structure interaction
 - Solved exercises
 - Introduction
 - Problem statement
 - Time discretization procedures
 - Spatial discretization procedures
 - Stabilized space-time formulations
 - Solved exercises
- 6 Viscous incompressible flows
 - Introduction

- Basic concepts
- Main issues in incompressible flow problems
- Trial solutions and weighting functions
- Stationary Stokes problem
- Steady Navier-Stokes problem
- Unsteady Navier-Stokes equations
- Applications and Solved Exercises
- References
