

- Introduction to Second Edition
- Control Concepts: A Non-Mathematical Introduction
- Control Design Ideas: A Non-Mathematical Treatment
- Synthesis of Automatic Feedback Control Loops: A More Quantitative View
- How the Laplace Transform Greatly Simplifies System Representation and Manipulation
- Frequency Response Methods
- Linearisation
- Mathematical Modelling
- Limits to Performance
- Some Practical Aspects of Control Design, Justification and Implementation
- Multivariable Linear Processes
- Discrete Time and Computer Control
- State Estimation: The Kalman Filter and Prediction
- Nonlinearity
- Optimisation
- Distributed Systems Introduction to Robust Control
- Design Using Hoo Methods
- Neural Networks
- Fuzzy Logic
- Genetic Algorithms
- Learning Systems
- Intelligent Systems
- Review - The Development of Control Theory and the Emergence of Artificial Intelligence (AI) Techniques
- Reference and Further Reading
- Index
