

- Preface
- General Introduction
- I Fundamentals
 - Dielectrics
 - Ferroelectrics
 - Electronic Properties and Quantum Effects
 - Magnetoelectronics - Magnetism and Magnetotransport in Layered Structures
 - Organic Molecules - Electronic Structures, Properties, and Reactions
 - Neurons - The Molecular Basis of their Electrical Excitability
 - Circuit and System Design
- II Technology And Analysis
 - Film Deposition Methods
 - Lithography
 - Material Removing Techniques - Etching and Chemical Mechanical Polishing
 - Analysis by Diffraction and Fluorescence Methods
 - Scanning Probe Techniques
- III LOGIC DEVICES
 - Silicon MOSFETs - Novel Materials and Alternative Concepts
 - Carbon Nanotubes for Data Processing
 - Ferroelectric Field Effect Transistors
 - Quantum Transport Devices Based on Resonant Tunneling
 - Single-Electron Devices for Logic Applications
 - Superconductor Digital Electronics
 - Quantum Computing Using Superconductors
 - Molecular Electronics
- IV Random Access Memories
 - High-Permittivity Materials for DRAMs
 - Ferroelectric Random Access Memories
 - Magnetoresistive RAM
- V Mass Storage Devices
 - Hard Disk Drives
 - Magneto-Optical Discs
 - Rewriteable DVDs Based on Phase Change Materials
 - Holographic Data Storage
 - AFM-Based Mass Storage - The Millipede Concept
- VI Data Transmission And Interfaces
 - Neuroelectronic Interfacing: Semiconductor Chips with Ion Channels, Nerve Cells, and Brain
 - Transmission on Chip and Board Level
 - Photonic Networks
 - Microwave Communication Systems - Novel Approaches for Passive Devices
- VII Sensor Arrays And Imaging Systems
 - Optical 3-D Time-of-Flight Imaging System
 - Pyroelectric Detector Arrays for IR Imaging

- Electronic Noses
- 2-D Tactile Sensors and Tactile Sensor Arrays
- VIII Displays
- Liquid Crystal Displays
- Organic Light Emitting Devices
- Field-Emission and Plasma Displays
- Electronic Paper
- Abbreviations
- Symbols
- Index.
- Authors
