

Table of Contents

Foundations of mathematical modelling. Lecture. 1.1 Cognition and modelling. 1.2 Natural sciences and Mathematics. 1.3 Content or form? 1.4 Copernicus or Ptolemy? 1.5 Mathematical model of a body falling. 1.6 Principles of mathematical model determining. 1.7. Classification of mathematical models. Appendix. 1. Probe movement. 2. Missile flight. 3 Glider flight. Notes. **I. Systems with lumped parameters.** **2. Approximate solving of differential equations.** Lecture. 2.1 Conception of approximate solution. 2.2 Euler method. 2.3 Probe movement. 2.4 Missile flight. 2.5. Glider flight. Appendix. 1. Runge-Kutta method. 2. Two-body problem. 3. Predator-pray model. Notes. **3. Mechanical Oscillations.** Lecture. 3.1. Determination of the pendulum oscillation equation. 3.2 Solving of the pendulum oscillation equation. 3.3 Pendulum oscillation energy. 3.4 Oscillation of a pendulum with friction. 3.5 Equilibrium position of the pendulum. 3.6 Forced oscillations of the pendulum. Appendix. 1. Spring oscillation. 2. Large pendulum oscillations. 3. Problems of nonlinear oscillation theory. Notes. **4 Electrical Oscillations.** **Lecture.** 4.1 Electrical circuit. 4.2 Energy of circuit. 4.3 Circuit with resistance. 4.4 Forced circuit oscillations. Appendix. 1. Forced oscillations of spring. 2. Circuit with nonlinear capacity. 3 Van der Pol circuit. Notes. **5. Elements of dynamical system theory.** Lecture. 5.1. Evolutionary processes and differential equations. 5.2 General notions of dynamic systems theory. 5.3 Change in species number with excess food. 5.4 Oscillations of pendulum. 5.5 Stability of the equilibrium position. 5.6 Limit cycle. Appendix. 1. Exponential growth systems. 2. Brussellator. 3. System with two limit cycle. Notes. **6. Mathematical models in chemistry.** Lecture. 6.1. Chemical kinetics equations. 6.2. Monomolecular reaction. 6.3. Bimolecular reaction. 6.4. Lotka reaction system. Appendix. 1. Brusselator. 2. Oregonator. 3. Chemical niche. 4. Laser healing model. Notes. **7. Mathematical model in biology.** Lecture. 7.1. One species evolution. 7.2. Biological competition model. 7.3 Predator-prey model. 7.4 Symbiosis model. Appendix. 1. Models of chemical and physical competition. 2. Fluctuations in yield and fertility. 3. Ecological niche model. 4. SIR model for spread of disease. 5. Antibiotic resistance model. Notes. **8. Mathematical model of economics.** Lecture. 1. One company evolution. 2. Economic competition model. 3. Economic niche model. 4. Free market model. 5. Monopolized market model. Appendix. 1. Ecological niche model. 2. Inflation model. 3. Model of economic cooperation. 4. Racketeer – entrepreneur model. 5. Solow model of economic growth. Notes. **9. Mathematical models in social sciences.** Lecture. 9.1. Political competition. 9.2. Political niche. 9.3. Bipartisan system. 9.4. Trade union activity. 9.5 Allied relations. Appendix. 1. Competition models. 2. Niche models. 3. Predator-prey models. Notes. **II. Systems with distributed parameters.** **10. Mathematical models of transfer processes.** Lecture. 10.1 Heat equation. 10.2 First boundary value problem for the homogeneous heat equation. 10.3 Non-homogeneous heat equation. Appendix. 1. Generalizations of the heat equation. 2. Second boundary value problem for the heat equation. 3. Diffusion equation. Notes. **11. Mathematical models of transfer processes.** Lecture. 1. Heat equation and similarity theory. 2. Goods transfer equation. 3. Finite difference method for the heat equation. 4. Diffusion of chemical reactants. 5. Stefan problem for the heat equation. Appendix. 1. Overview of transfer processes. 2. Finite difference method. Implicit scheme. 3. Competitive species migration. 4. Hormone treatment of the tumor with hormone resistance. Notes. **12. Wave processes.** Lecture. 12.1. Vibration of string. 12.2. Vibrations of string with fixed ends. 12.3 Infinitely long string. 12.4. Electrical vibrations in wires. Appendix. 1. Energy of vibrating string. 2. Mathematical models of wave processes. 3. Beam vibrations. 4. Maxwell equations. 5. Finite difference method for the vibrating string

equation. Notes. **13. Mathematical models of stationary systems.** Lecture. 13.1. Stationary heat transfer 13.2. Spherical and cylindrical coordinates. 13.3 Vector fields. 13.4. Electrostatic field. 13.5 Gravity field. Appendix. 1. Stationary fluid flow. 2. Steady oscillations. 3. Bending a thin elastic plate. 4. Variable separation method for the Laplace equation in a circle. 5. Establishment method. Notes. **14. Mathematical models of fluid and gas mechanics.** Lecture. 14.1. Vibration string equation. 14.2. Ideal fluid movement. 14.3. Ideal fluid under the gravity field. 14.4. Viscous fluid movement. Appendix. 1. Burgers equation. 2. Surface wave movement. 3. Boundary layer model. 4. Acoustic problem. 5. Thermal convection. 6. Problems of magnetohydrodynamics. Notes. **15. Mathematical models of quantum mechanical systems.** Lecture. 15.1. Quantum mechanics problems. 15.2. Wave function. 15.3. Schrödinger equation. 15.4. Particle movement under an external field. 15.5. Potential barrier. Appendix. 1. Wave function normalization. 2. Particle movement in a well with infinitely high walls. Notes. **III. Other mathematical models. 16. Variational principles.** Lecture. 1. Brachistochrone problem. 2. Lagrange problem. 3. Shortest curve. 4. Body falling problem and the concept of action. 5. Principle of least action. 6. Vibrations of string. Appendix. 1. Law of conservation of energy. 2. Fermat's principle and light refraction. 3. River crossing problem. 4. Pendulum oscillations. 5. Approximate solution of minimization problems. Notes. **17. Discrete models.** Lecture. 17.1. Discrete population dynamics models. 17.2. Discrete heat transfer model. 17.3. Transportation problem. 17.4. Traveling salesman problem. 17.5. Prisoner's Dilemma. Appendix. 1. Discrete model of epidemic propagation. 2. Potential method for solving a transportation problem. 3. Production planning. 4. Concepts of game theory. Notes. **18. Stochastic models.** Lecture. 18.1. Stochastic model of pure birth. 18.2. Monte Carlo method. 18.3. Stochastic model of population death. 18.4. Stochastic Malthus model. Appendix. 1. Malthus model with random population growth. 2. Models with random parameters. 3. Discrete model of selling goods. 4. Passage of a neutron through a plate. Notes. **IV. Additions. 19. Mathematical problems of mathematical models.** Lecture. 19.1. Cauchy problem properties for differential equations. 19.2. Properties of boundary value problems. 19.3. Boundary value problems for the heat equation. 19.4. Hadamard's example and well-posedness of problems. 19.5. Classical and generalized solution of problems. Appendix. 1. Nonlinear boundary value problems. 2. Euler's elastic problem. 3. Bénard problem. 4. Generalized model of stationary heat transfer. 5. Sequential model of stationary heat transfer. Notes. **20. Optimal control problems.** Lecture. 20.1. Maximizing the shell fight range. 20.2. Maximizing the missile fight range. 20.3. General optimal control problem. 20.4. Solving of the maximization problem of the missile fight range. 20.5. Time-optimal control problem. Appendix. 1. Maximizing the probe's ascent height. 2. Approximate methods for solving optimality conditions. 3. Gradient methods. Notes. **21. Identification of mathematical models.** Lecture. 21.1. Problem of determining the system parameters. 21.2. Inverse problems and their solving. 21.3. Heat equation with data at the final time. 21.4. Differentiation of functionals and gradient methods. 21.5. Solving of the heat equation with reversed time. Appendix. 1. Boundary inverse problem for the heat equation. 2. Inverse problem for the falling of body. 3. Inverse gravimetry problem. 4. Well-posedness of optimal control problems. Notes. Epilogue. Bibliography. Index.
